I. Description Of The Problem

1. Introduction to the problem

- According to a newly published survey of Microsoft, Vietnam is in the top 5 countries with the lowest civility index in cyberspace (DCI).
- Although this survey result is detrimental to the image of the Vietnamese online community, it does not create a wave of protests from users. According to a survey on Zing.vn, 87% of readers agree with Microsoft's ranking of Vietnam in the top 5 countries that behave poorly on the Internet.

- Since then, the group has selected articles that detect vulgar and offensive comments from the comments. The problem of detecting vulgar and offensive comments on the most popular social networking platform today is Facebook.

2. Description of input and output

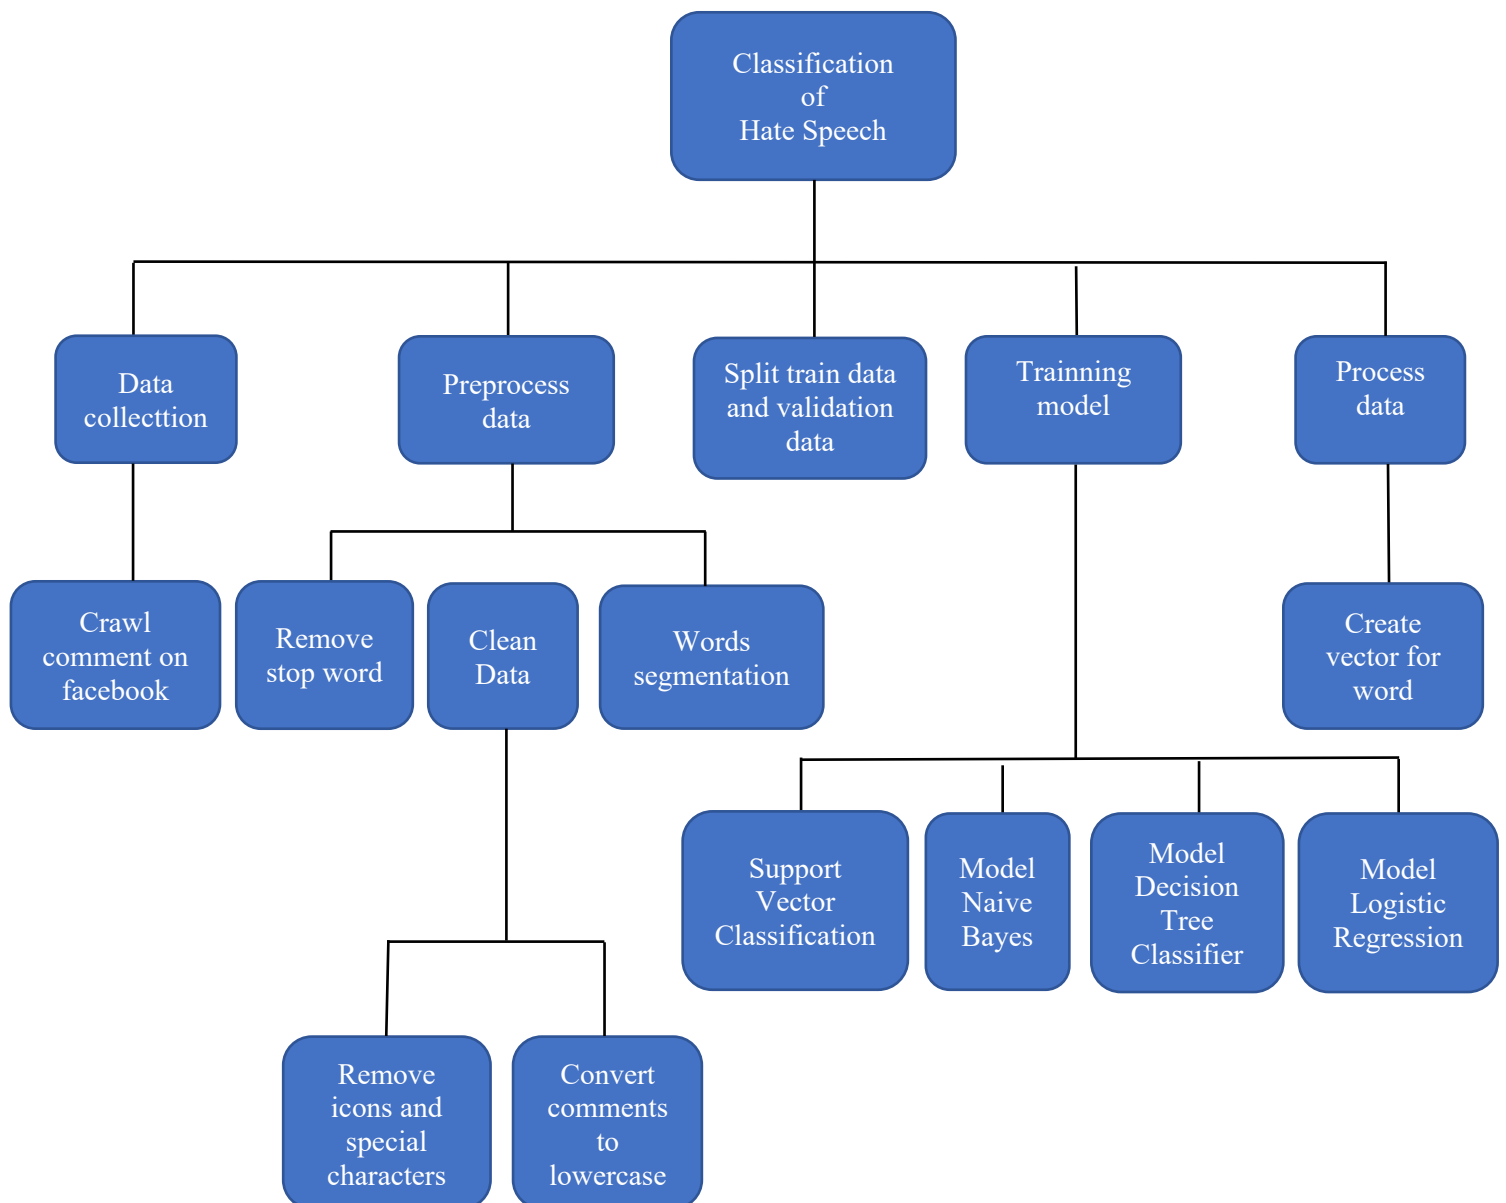

- **Input:** One hate speech (**comments**) on social network (**Facebook**).

- **Output:** A result returned is of type **boolean**.

+ If it is a hate speech, it will return **TRUE**.

+ If it is not hate speech, it will return **FALSE**.

3. Hierarchical structure

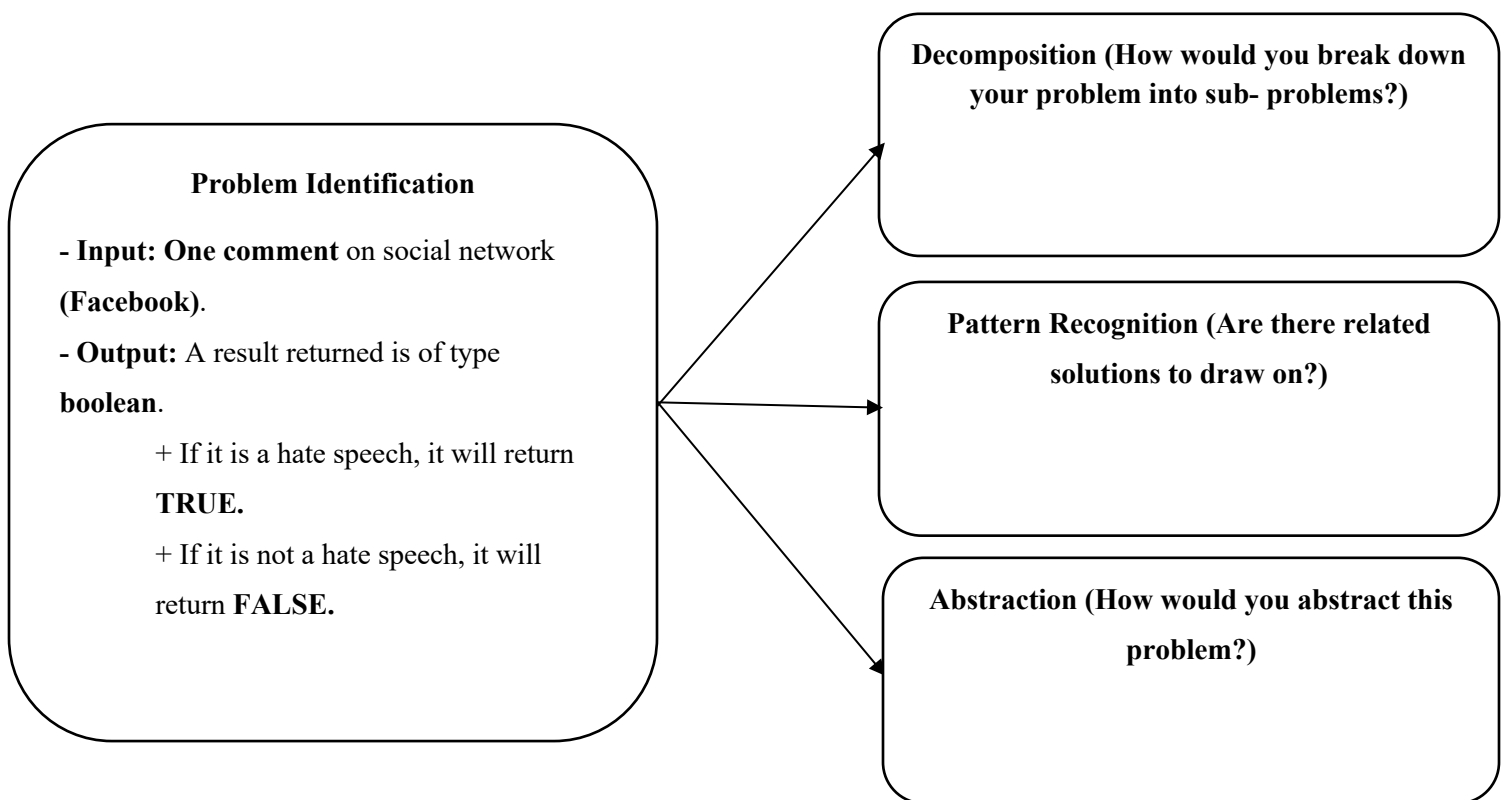

4. Model evaluation

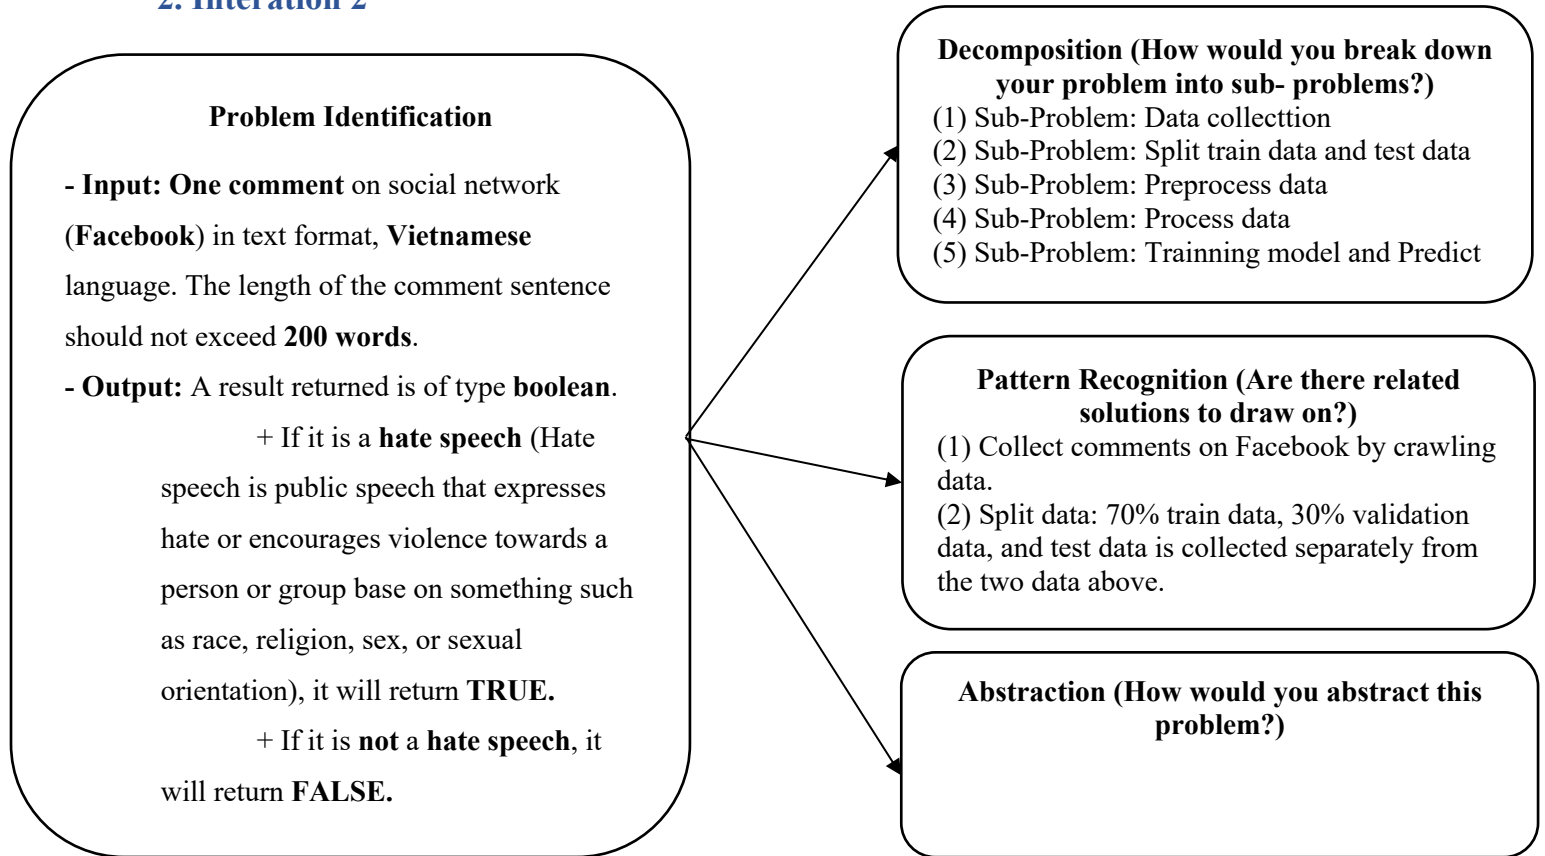

- **Data Availability:** The group will crawl comments on the social network (**facebook**). Label comment as **1** with **hate speech** and label comment as **0** with **not hate speech**.
- **Accuracy** is evaluated based on **the number of correctly predicted comments/ predicted number of comments**.

II. Graphic Organizer

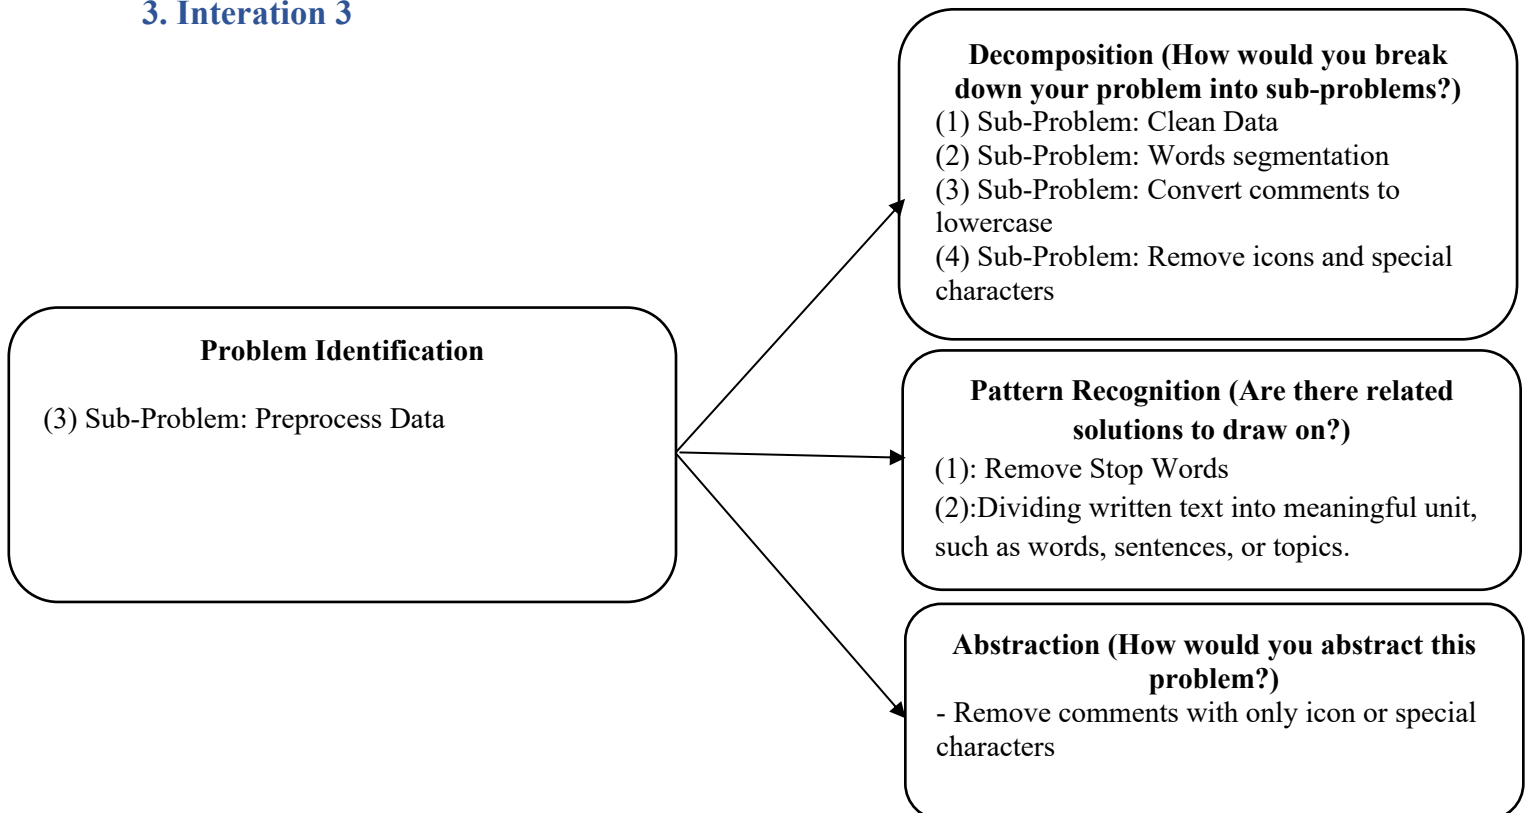

1. Iteration 1

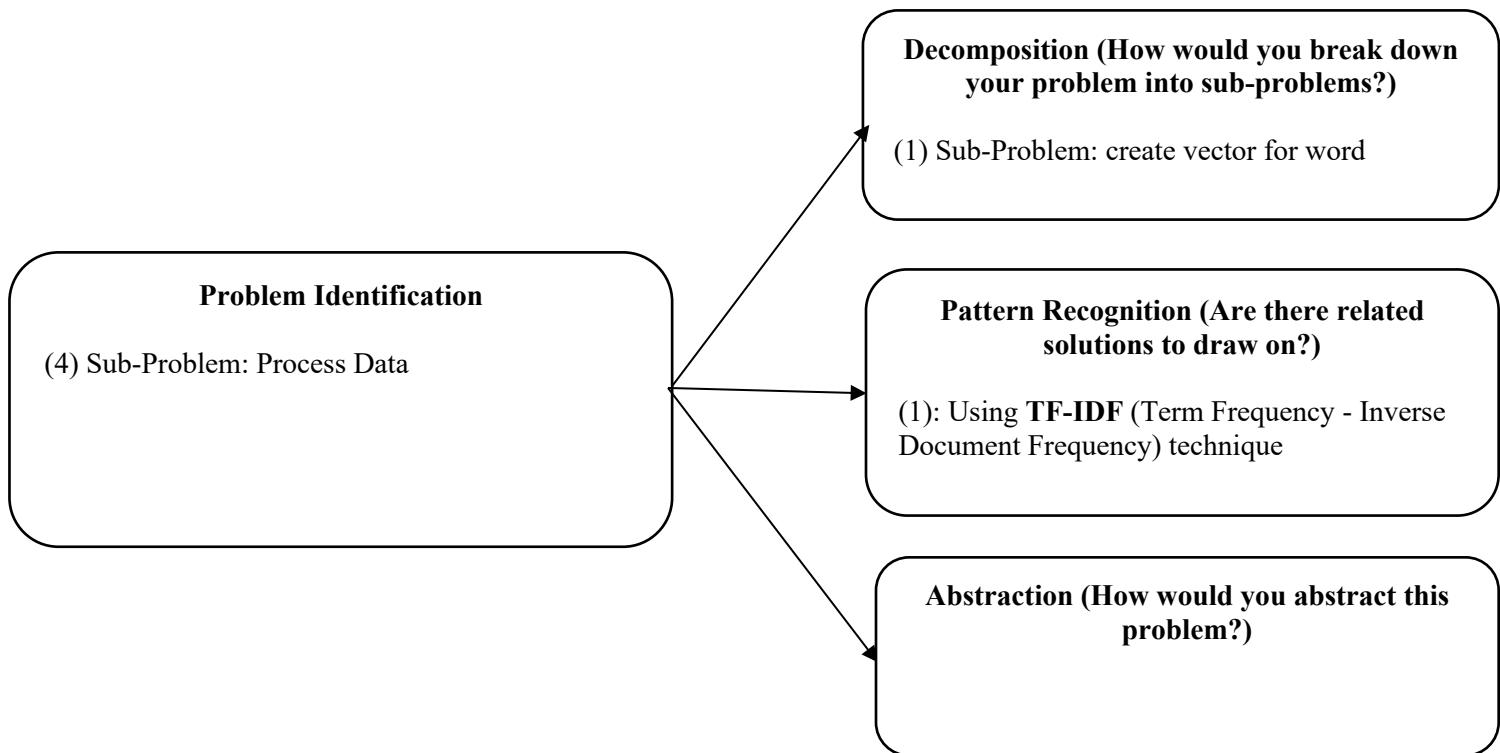

2. Iteration 2

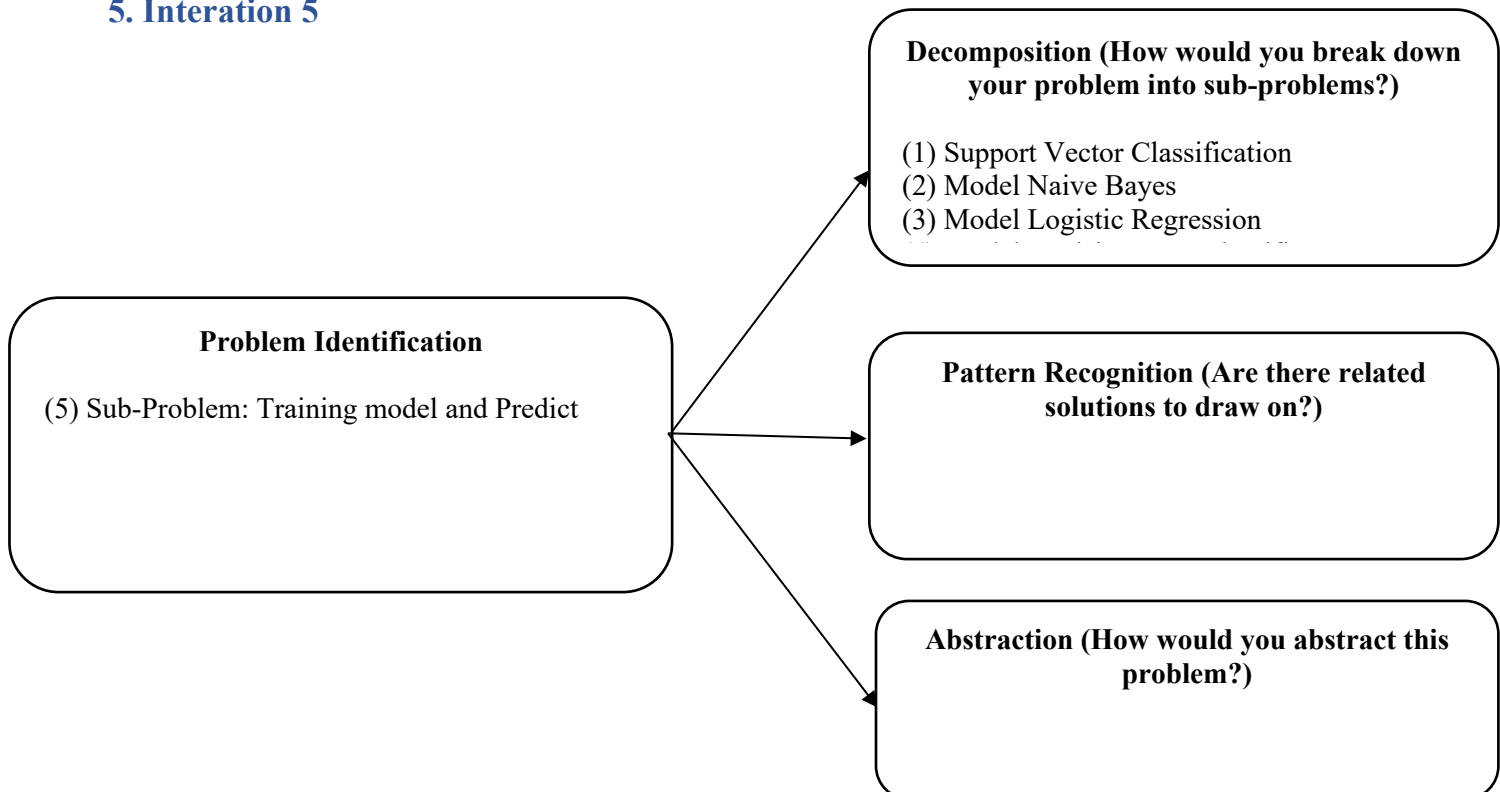

3. Iteration 3

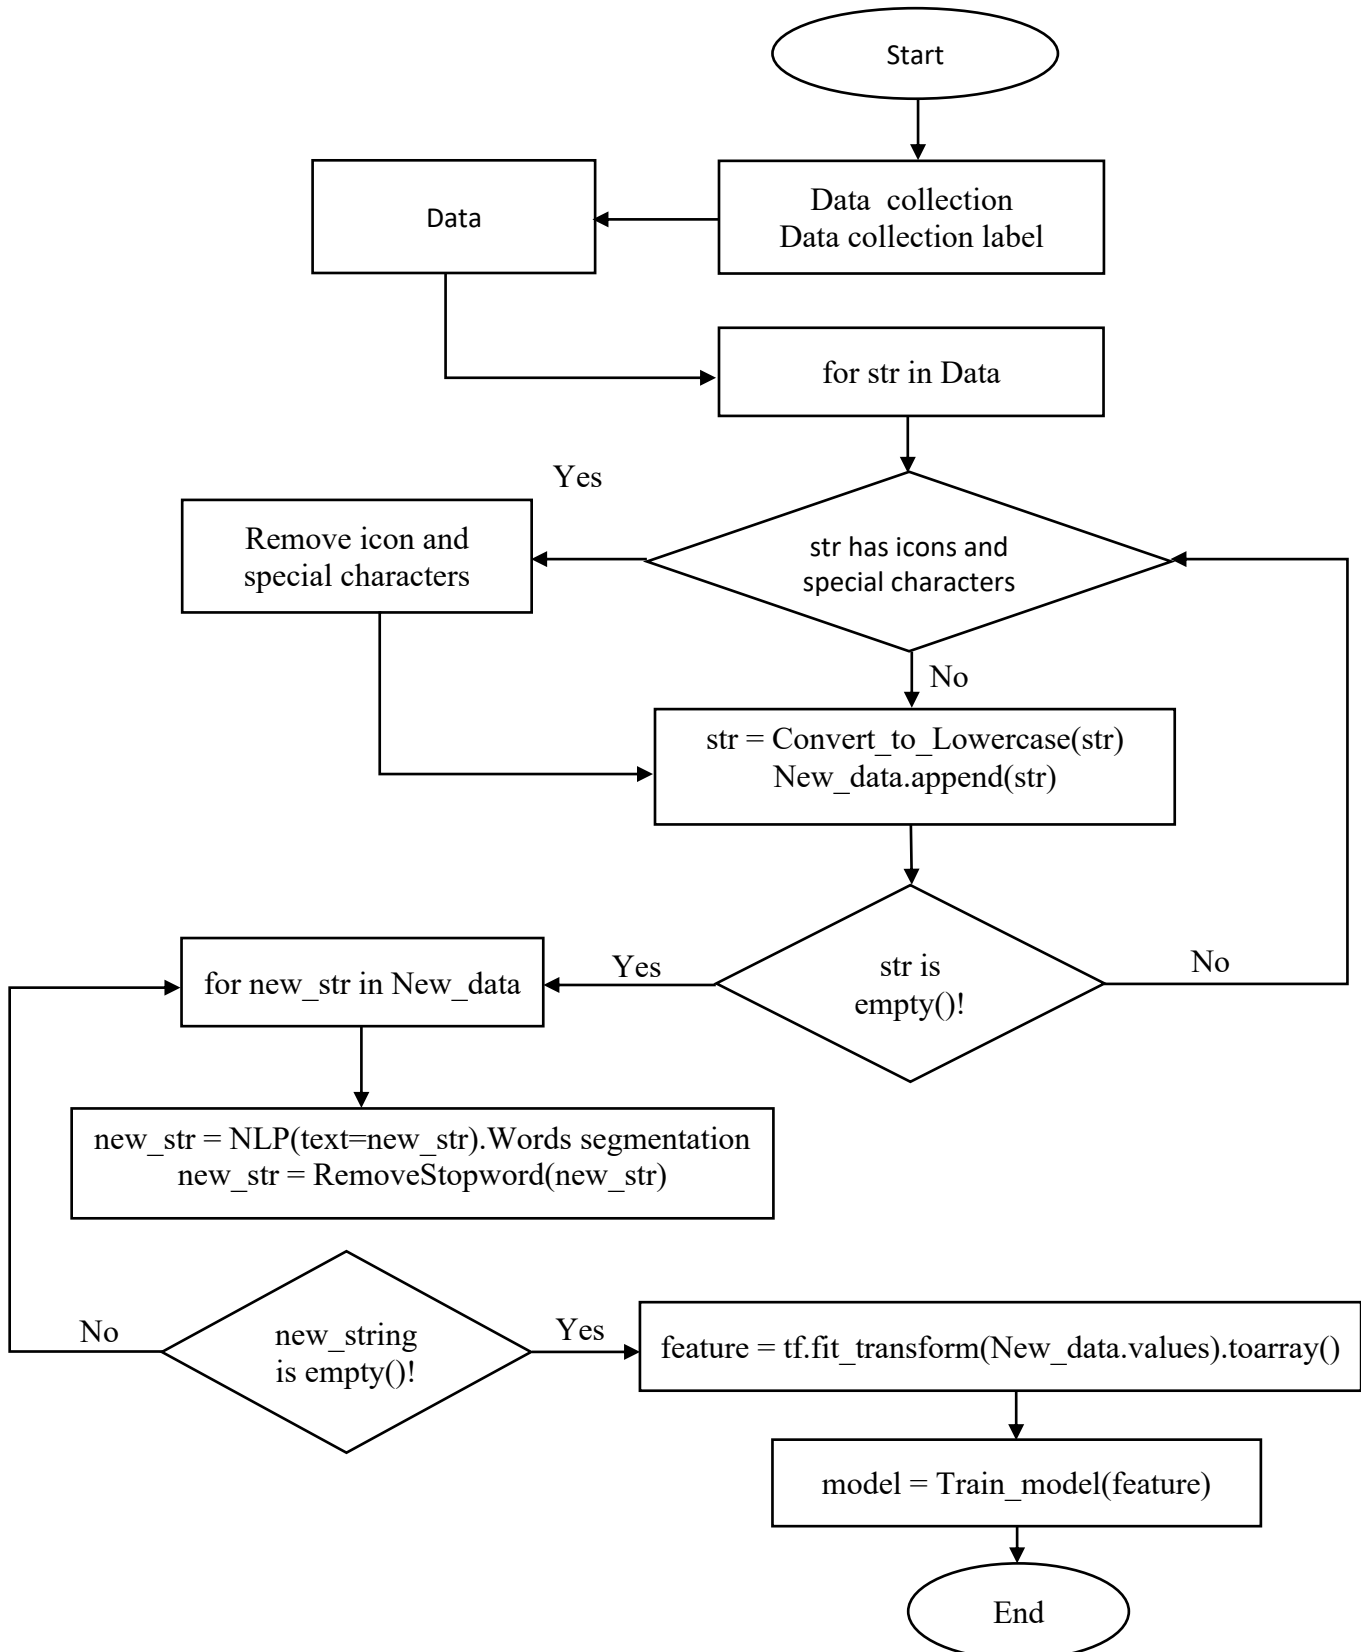

4. Iteration 4

5. Iteration 5

III. Algorithm Flowchart

IV. Techniques Applied In The Problem

- In this section, the group will **present** the above **Decomposition** techniques to solve this problem: **TF-IDF** (Term Frequency - Inverse Document Frequency), **Remove Stopword**, **Text segmentation**.

1. TF-IDF (Term Frequency – Inverse Document Frequency)

- **TF-IDF** (Term Frequency – Inverse Document Frequency) is a numerical statistic that is intended to reflect how important a word is to a **document** in a collection or **corpus**. It is often used as a **weighting factor** in searches of information retrieval, **text mining**, and **user modeling**.

- **TF**: Term Frequency (Frequency of a word) is the number of times the word appears in the text.

$$tf(t, d) = \frac{f(t, d)}{\max\{f(w, d) : w \in d\}}$$

Image 2: Formula to calculate Term Frequency

In there:

- $tf(t, d)$: the frequency of occurrence of the **word t** in the **text d**.
- $f(t, d)$: Number of occurrences of the **word t** in the **text d**.
- $\max(\{f(w, d) : w \in d\})$: The number of occurrences of the word with **the most occurrences** in the **text d**.

- **IDF**: Inverse Document Frequency (Inverse of text frequency), helps to assess the importance of a word.

$$idf(t, D) = \log \frac{|D|}{|\{d \in D : t \in d\}|}$$

Image 3: Formula to calculate Inverse Document Frequency

In there:

- $\text{idf}(t, D)$: idf value of word t in corpus.
- $|D|$: Total number of texts in the **set D**.
- $|\{d \in D : t \in d\}|$: represents the number of documents in **set D** containing the **word t**.

2. Text segmentation

- **Text segmentation** is the process of dividing written text into meaningful units, such as **words**, **sentences**, or **topics**. The term applies both to **mental processes** used by humans when reading text, and to artificial processes implemented in computers, which are the subject of **natural language processing**.

Image 4: Demo Text segmentation

- ex = “ Nguyễn Quang Hải là cầu thủ bóng đá chuyên nghiệp của đội tuyển Việt Nam”

`print NLP(text=ex).segmentation()`

→ “Nguyễn_Quang_Hải là cầu_thủ bóng_đá chuyên_nghiep của đội_tuyển Việt_Nam”

3. Remove Stopword

- **Remove Stopword** is to pick out the **important words** or **phrases** in a sentence and **remove unnecessary words** in the sentence. Those removed words are called **Remove StopWord** that have **no meaning** in the classification.

Image 5: Demo Remove StopWord

V. Description Of The Dataset.

- How to collect datasets:

- + Select a few articles on the social network facebook that caused a stir in the online community.

- + Get all comments in those articles by crawling.

- The group will take the data **available** on **github** ([ducvuuit/CS114.K21.KHTN](https://github.com/ducvuuit/CS114.K21.KHTN)) to train the model. Split data into: 70% Train data, 30% Validation data from 4746 comments.

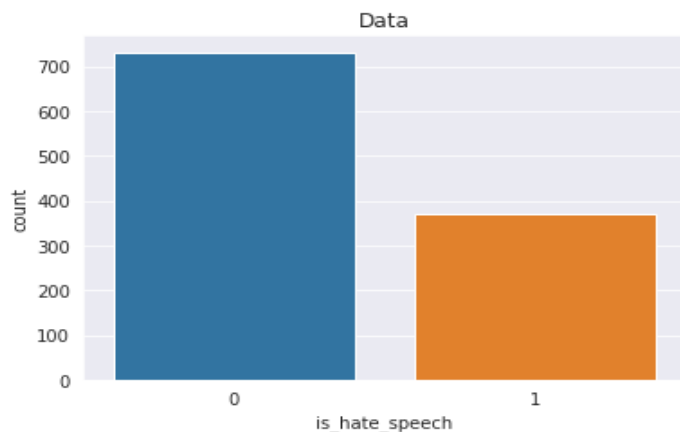

- + 2121 comments are **hate speech**.

- + 2643 comments are **not hate speech**.

Image 6: The graph shows the amount of data

- The group collected more data to make its own **Test set**. Then proceed filtered out duplicate comments, comments only contain icons, comments have no meaning, ...

- More than 2000 comments after the group filtered and labeled, the group received 1102 comments.

- + 371 comments are **hate speech**.

- + 731 comments are **not hate speech**.

Image 7: The graph shows the amount of validation set

- Link the group's Github: <https://github.com/trong-khanh-1109/CS117.L22.KHCL>

VI. Result Evaluation

- With the problem of classifying **hate speech** on the social network facebook, the group will use the following models to train:

- Support Vector Classification
- Model Naive Bayes
- Model Logistic Regression
- Model Decision Tree Classifier

1. Support Vector Classification

```
[27] print("Evaluating by model SVC...")
      model_SVC = LinearSVC()
      model_SVC.fit(X_train, Y_train)
      Y_pred_val = model_SVC.predict(X_val)
      Y_pred_test = model_SVC.predict(X_test)
```

- Results on validation set:

	precision	recall	f1-score	support
0	0.83	0.91	0.86	771
1	0.88	0.78	0.82	659
accuracy			0.85	1430
macro avg	0.85	0.84	0.84	1430
weighted avg	0.85	0.85	0.85	1430

→ Accuracy: 86%

- Results on test set:

	precision	recall	f1-score	support
0	0.84	0.85	0.84	731
1	0.70	0.67	0.68	371
accuracy			0.79	1102
macro avg	0.77	0.76	0.76	1102
weighted avg	0.79	0.79	0.79	1102

→ Accuracy: 79%

2. Model Naive Bayes

```
[32] print("Evaluating by model Naive Bayes...")
      model_NB = MultinomialNB()

      model_NB.fit(X_train, Y_train)
      Y_pred_val = model_NB.predict(X_val)
      Y_pred_test = model_NB.predict(X_test)
```

- Results on validation set:

	precision	recall	f1-score	support
0	0.76	0.94	0.84	771
1	0.90	0.66	0.76	659
accuracy			0.81	1430
macro avg	0.83	0.80	0.80	1430
weighted avg	0.83	0.81	0.80	1430

→Accuracy: 81%

- Results on test set:

	precision	recall	f1-score	support
0	0.79	0.91	0.85	731
1	0.75	0.51	0.61	371
accuracy			0.78	1102
macro avg	0.77	0.71	0.73	1102
weighted avg	0.77	0.78	0.77	1102

→Accuracy: 78%

3. Model Logistic Regression

```
[34] print("Evaluating by model Logistic Regression...")
      model_LG = LogisticRegression()

      model_LG.fit(X_train, Y_train)
      Y_pred_val = model_LG.predict(X_val)
      Y_pred_test = model_LG.predict(X_test)
```

- Results on validation set:

	precision	recall	f1-score	support
0	0.78	0.94	0.85	771
1	0.91	0.69	0.78	659
accuracy			0.82	1430
macro avg	0.84	0.81	0.82	1430
weighted avg	0.84	0.82	0.82	1430

→Accuracy: 82%

- Results on test set:

	precision	recall	f1-score	support
0	0.82	0.86	0.84	731
1	0.69	0.64	0.67	371
accuracy			0.78	1102
macro avg	0.76	0.75	0.75	1102
weighted avg	0.78	0.78	0.78	1102

→Accuracy: 78%

4. Model Decision Tree Classifier

```
[36] print("Evaluating by model Decision Tree Classifier...")
      model_DT = DecisionTreeClassifier()

      model_DT.fit(X_train, Y_train)
      Y_pred_val = model_DT.predict(X_val)
      Y_pred_test = model_DT.predict(X_test)
```

- Results on validation set:

	precision	recall	f1-score	support
0	0.83	0.87	0.85	771
1	0.84	0.80	0.82	659
accuracy			0.84	1430
macro avg	0.84	0.83	0.84	1430
weighted avg	0.84	0.84	0.84	1430

→Accuracy: 84%

- Results on test set:

	precision	recall	f1-score	support
0	0.82	0.86	0.84	731
1	0.69	0.64	0.67	371
accuracy			0.78	1102
macro avg	0.76	0.75	0.75	1102
weighted avg	0.78	0.78	0.78	1102

→Accuracy: 78%

* Review

Model	Support Vector Classification	Model Naive Bayes	Model Logistic Regression	Model Decision Tree Classifier
Validation	86%	81%	82%	84%
Test	79%	78%	78%	78%

- Model Decision Tree Classifier and Logistic Regression gives accuracy on the highest validation set (78%). Model SVC gives accuracy on the highest test set (86%).

- Because the test set collected from the article has a different topic than the train set, there are many keywords that are not in the vocabulary of TfidfVectorizer. Leads to the accuracy of the test set is not high.

- The group referenced the results from the Kaggle ([Toxic Comment Classification Challenge](#)) with data in English.
- The results are below [Brandon Benton's](#) reference group on Kaggle.

Model	Decision Tree Classifier	Kneighbors Classifier	Random Forest Classifier
Scores	0.892	0.9	0.914

- Compared to the group's model, the results will be higher because English is much simpler than Vietnamese. Moreover, Vietnamese comments are misspelled quite a lot.

VII. The Duty Roster

Number	Name	Assigned Work	Completion Level (%)
1	Võ Phạm Duy Đức – 19521383 - Leader -	Code	100%
2	Đỗ Trọng Khánh – 19521676 - Member -	Wirte report	100%
3	Trịnh Công Danh - 19521326 - Member -	Crawl and label data	100%
